# Can't run app on device when it installed from debug apk file

It has been a long time since I last post, today I want to share for you an occurred problem recently when I start a new Android project.

First, let us examine the outline what i do before find solution for problem.

- I create a new Android project with AndroidStudio 2.3
- Some code added to this project
- Run project on emulator
- I must test application with real device but I can't enable USB Debugging on this device. Then I copy debug apk file to this device and install.
- Install successfully. I open this application and has occurred an error. This application open with a crash :(
- I using a Logcat app on Android to catch error and see the message

```
E/AndroidRuntime: FATAL EXCEPTION: main  
at android.app.ActivityThread.performLaunchActivity(ActivityThread.java:2318)
```
